

NEKTON®-LORI

Nectar Concentrate

Carbohydrates - Protein - Fats - Vitamins - Mineral Elements
Complete Diet for all Lories and Hanging Parakeets

In the past keeping the various types of Lories has often proved difficult, mainly because of feeding problems. Now NEKTON-LORI can help solve all these difficulties, for it has been especially developed with the particular dietary demands this delicate sub-species of parrot can make in mind.

NEKTON-LORI contains all the vital components necessary for the organism of these birds:

A carefully selected combination of carbohydrates similar to flower nectar, which represents an essential part of the Lory's nourishment and provides the necessary energy for a Lory's basal metabolism.

Protein, which was combined to take the unusual digestive system of these birds into account. NEKTON-LORI contains 18 different amino acids in L-form, which means the dietary protein is already broken up into its components thus enabling it to be fully adsorbed in spite of the bird's fast combustion. The 18 different amino acids and the addition of various sophisticated proteins, not forgetting finely ground bee pollen, ensure your bird of all the vital protein elements and maintain the basal metabolism.

Various fatty acids that have been added in tiny quantities only, as this bird's organism enables it to form sufficient fats from the carbohydrates already in the diet.

Vitamins

The more nutritious the feed, the better the proportion of vitamins must be. Thus the 13 vitamins plus provitamins in NEKTON-LORI play a very important role.

Vitamins are vital organic substances and those vitamins in NEKTON-LORI have been attuned to the particular requirements of this group of birds. Among others, an appropriate share of Vitamin A, because of its ability to protect the outer tissue of the respiratory organs, digestive and reproductive organs; a high percentage of the B block vitamins because of their excellent work in the basal metabolism and, last but not least, a large amount of biotin by reason of its influence on the metabolism have all been included to assist the synthesis of the Lory's own antibodies.

Minerals (macro and trace elements), because they constitute essential substances and must be supplied regularly by means of the diet.

A Lory's organism is unable to store most of these vitamins and mineral elements so that a lack or insufficient supply of only one of these substances would automatically lead to serious damage to the organs. NEKTON-LORI gives you assurance that your bird is getting the best possible coverage in nutrients and effective substances. The most important prerequisite for the successful keeping and rearing of all Lory varieties, especially the most sensitive, is a well-balanced diet containing just the right combination of nutrients (carbohydrates, protein, fats) and activating substances (vitamin, minerals) so that they complement each other. In many cases the presence of one is an absolute requirement before the other can work.

In addition, this diet has two tremendous advantages over other feeding methods:

There is no food matter left sticking to the beak to foster fungus growth.

All the ingredients are fully assimilated by the body so that the faeces consist of little more than water, meaning no smell or messy droppings to dirty the cage or aviary.

NEKTON-LORI is the result of years of experience with such demanding varieties as Chamosyna, Trichoglossus and the hanging parakeets, Loriculini, and has now reached a high scientific level. Private collectors, zoos and avian parks have used it successfully for years. In addition, however, we have found that NEKTAR-PLUS can also be used as an excellent and complete diet for small lorikeets. For some time now we have been rearing and keeping such lorikeets as the Whiskered and Red-flanked Lorikeet on a sole diet of NEKTAR-PLUS without any loss whatsoever. In fact results have been even better than feeding them on NEKTON-LORI. Try it out yourself and you won't be disappointed.

USAGE

NEKTON-LORI is complete diet in water-soluble powder form, making the previous mixing of various ingredients and substances totally unnecessary.

Dosage:

In Gram

10 g NEKTON-LORI to 100 ml (1/3 oz to 1/5 pint) lukewarm (30°C) water

In Millilitre

20 ml NEKTON-LORI to 100 ml lukewarm (30°C) water

As you can see the concentrated form of NEKTON-LORI means a little goes a long way.

N.B.:

When using NEKTAR-PLUS for small lorikeets the dosage is different.

In Gramm

16 g NEKTAR-PLUS to 100 ml lukewarm (30°C) water

In Millilitre

20 ml NEKTAR-PLUS to 100 ml lukewarm (30°C) water

Dissolve powder in water by stirring slowly. Do not use foodmixer or whisk as this can destroy some vitamins, resulting in the destruction of the careful balance of vitamins to the detriment of the bird. The solution can now be poured into the feeding dispensers.

Please keep to the stated amount of NEKTON-LORI to 100ml water. An increased dose can lead to damage to your pet's health. The same applies to adding any supplement to the food; this could upset the existing balance of nutrients and effective substances and do more harm than good. A further factor which could make your bird's health suffer is the fact that any liquid nourishment containing a high percentage of protein, NEKTON-LORI too, turns sour in the course of the day. This means either making up the solution fresh twice a day, an impossibility for the working owner, or using the combination NEKTON-LORI and DESI-PLUS.

DESI-PLUS is a disinfectant to be used as a final cleansing solution for all feeding utensils. After washing as usual, put the feeding bowl, dispenser, measuring beaker, etc., into the DESI-PLUS solution overnight. Remove them next morning and leave to dry - do not rinse or wipe dry. The NEKTON-LORI mixture for the day can now be filled into germ-free feeding utensils. This mixture will now keep twice as long and without any danger to your pet's health. Not only is this method time-saving and avoids wastage but it also aids prevention of possible illnesses such as gastritis or fungus growth.

If possible, the feeding containers should be ceramic or china as plastic tends to become brittle after frequent contact with DESI-PLUS.

NEKTON-LORI makes preparing your pet's feed easy. DESI-PLUS makes it even easier.

IMPORTANT

Store in a cool, dark and dry place. In an unopened container and correctly stored the vitamins in NEKTON-LORI remain effective until date of expiry, see extra label.
